

## **ABSTRACT OF THE DISCLOSURE**

The golf practice apparatus has a large target supported by two supports connected at diametrically opposed areas on the large target. For stability, the two supports are connected to one another by a cross member and ground stakes engaging the supports can be inserted into the ground. Successively smaller targets are connected to the larger target. The smaller targets are connected to the large target by a pair of straps. Each pair of straps consists of two sections. The straps are sewn to the middle sized target and have two ends extending radially in each direction from the large target. The straps are wrapped around and secured to both the large target and smaller target. Once wrapped around the respective target, the strap is secured to itself by such conventional means as snaps. In this manner, the smaller target can be removed from the middle target and the middle target can be removed from the larger target. This gives the golfer the option of having just the large target, the large and middle size target, or all three targets, available to receive his/her practice shots.
